Abstract

Managing daily tasks and meeting deadlines has become difficult for students and working professionals because priorities often change and unexpected work can affect planned schedules. Most task management applications allow users to create and organize tasks, but they do not adapt to the user's behaviour or changing workload. Users have to manually update priorities and schedules, which can reduce productivity.

The Adaptive Task Management System is developed to make task management smarter and more efficient. The application allows users to create, update, organize, and track their tasks in one place. Unlike a regular task manager, the system adapts based on the user's activity. For example, it can increase the priority of repeatedly postponed tasks, suggest a better schedule for overdue tasks, provide productivity reports, and recommend which tasks should be completed first. These adaptive features help users manage their work more effectively.

The project will be developed using React for the frontend, Node.js and Express.js for the backend, and MongoDB as the database. JWT authentication will be used to provide secure login and user management.

The main goal of this project is to apply the concepts of Adaptive Software Engineering by building a system that can adjust its behavior based on user interactions. This project aims to improve productivity, help users manage their time better, and provide a more personalized task management experience compared to traditional task management applications.

Proposed System

The Adaptive Task Management System will be developed as a full-stack web application using React for the frontend, Node.js and Express.js for the backend, and MongoDB as the database. JWT (JSON Web Token) authentication will be used to provide secure user login and account management. The application will allow users to create, edit, delete, and categorize tasks, set priorities and deadlines, track task progress, and view their tasks through an easy-to-use dashboard and calendar view.

The key feature of the system is its adaptive functionality. Instead of working like a regular task manager, the application will analyze user activity and automatically adjust task priorities based on factors such as missed deadlines, postponed tasks, and completion history. It will also suggest daily tasks, generate productivity reports, provide smart reminders, and reschedule overdue tasks whenever required. These adaptive features help users manage their work more efficiently while providing a personalized task management experience.
